ABSTRACT

This work aims to show the landscapes of Pará in order to reflect that the testimony of all historical evolutions represents a distinct scenario that contains specificity of each place. Thus, it is important to note that the natural landscapes in the geographic space of Pará, besides being very important (relief, climate, vegetation and hydrography) represent the greatest wealth of several communities that have always been part of this panorama. Watching for this natural wealth is protecting the very people who live in the territory, with their culture and traditions and whose means of survival, are taken from natural resources. Thus, it is necessary to ensure measures of solutions so that the balance between economic development and healthy quality of life can be possible due to the processes of production and consumption. Faced with this issue, it is extremely important to take measures to minimize negative impacts on the environment and the Federal Constitution is crystal clear when it expressly guarantees to all citizens the right to a dignified existence that is related to the socioeconomic development of the individual, which must necessarily occur in accordance with the guidelines for the protection of the environment and its natural resources. Therefore, the work opens the gap and the first to realize that when natural resources are no longer preserved through human action, there is harmful interference with the ecological system, which leads to losses in productive capacity due to environmental degradation, which in synthesis , represents the fruit of the systemic pollution of the environment with undesirable change through human action. Faced with this question, the paper proposes how human action can cause irreparable damages to the environment, giving rise to degradation and considerably affecting the sustainability caused by the loss of natural resources.

Keywords: Natural resources. Sustainability. Human action. Degradation
